UniProt Comments for gbpA	Probably interacts with GlcNAc residues. May promote attachment to both epithelial cell surfaces and chitin. This function enhances bacterial colonization in the gastrointestinal tract and may also be important in the environment by augment colonization of chitinous structures, leading to improved survival. Promotes bacterial attachment to, and colonization of, zooplankton in the aquatic ecosystem.
Research Articles on gbpA	**1.** there is a coordinated interaction between GbpA and mucin to upregulate each other , leading to increased levels of expression of both of these interactive factors and allowing successful intestinal colonization and pathogenesis by V. cholerae.
