NCBI Protein Information	thymidine kinase, cytosolic
NCBI Summary for TK1	The protein encoded by this gene is a cytosolic enzyme that catalyzes the addition of a gamma-phosphate group to thymidine. This creates dTMP and is the first step in the biosynthesis of dTTP, which is one component required for DNA replication. The encoded protein, whose levels fluctuate depending on the cell cycle stage, can act as a low activity dimer or a high activity tetramer. High levels of this protein have been used as a biomarker for diagnosing and categorizing many types of cancers. [provided by RefSeq, Oct 2016]
Research Articles on TK1	**1.** Study demonstrates that, in plasma-derived exosomes, increase in TK1 and CDK9 mRNA copies is associated with clinical resistance of metastatic breast cancer to palbociclib.
