NCBI Summary for CHIC2	This gene encodes a member of the CHIC family of proteins. The encoded protein contains a cysteine-rich hydrophobic (CHIC) motif, and is localized to vesicular structures and the plasma membrane. This gene is associated with some cases of acute myeloid leukemia. [provided by RefSeq, Jul 2008]

UniProt Comments for CHIC2	Subcellular location: Cell membrane. Cytoplasmic vesicle. Note: Also present at a Golgi-like vesicular compartment and at scattered vesicles. Ref.5 Post-translational modification: Palmitoylation in the CHIC motif is required for membrane association. Ref.5 Involvement in disease: A chromosomal aberration involving CHIC2 is found in a form of acute myeloid leukemia (AML). Translocation t(4;12)(q12;p13) with ETV6. Sequence similarities: Belongs to the CHIC family.
