NCBI Summary for PANK2	This gene encodes a protein belonging to the pantothenate kinase family and is the only member of that family to be expressed in mitochondria. Pantothenate kinase is a key regulatory enzyme in the biosynthesis of coenzyme A (CoA) in bacteria and mammalian cells. It catalyzes the first committed step in the universal biosynthetic pathway leading to CoA and is itself subject to regulation through feedback inhibition by acyl CoA species. Mutations in this gene are associated with HARP syndrome and pantothenate kinase-associated neurodegeneration (PKAN), formerly Hallervorden-Spatz syndrome. Alternative splicing, involving the use of alternate first exons, results in multiple transcripts encoding different isoforms. [provided by RefSeq, Jul 2008]
UniProt Comments for PANK2	May be the master regulator of the CoA biosynthesis.
Research Articles on PANK2	**1.** Tissue or cellular hypoxic/ischemic injury within the globus pallidus may underlie the pathogenesis of pantothenate kinase-associated neurodegeneration due to PANK2 mutations and apoE aggregates.
