UniProt Comments for MLLT10	MLLT10: Probably involved in transcriptional regulation. In vitro or as fusion protein with MLL has transactivation activity. Binds to cruciform DNA. A chromosomal aberration involving MLLT10 is associated with acute leukemias. Translocation t(10;11)(p12;q23) with MLL/HRX. The result is a rogue activator protein. A chromosomal aberration involving MLLT10 is associated with diffuse histiocytic lymphomas. Translocation t(10;11)(p13;q14) with PICALM. 2 isoforms of the human protein are produced by alternative splicing. Protein type: Oncoprotein; Transcription factor Chromosomal Location of Human Ortholog: 10p12 Cellular Component: nucleoplasm; cytoplasm Molecular Function: protein binding; DNA binding; zinc ion binding; transcription factor activity Biological Process: transcription, DNA-dependent; positive regulation of transcription from RNA polymerase II promoter Disease: Leukemia, Acute Myeloid
Research Articles on MLLT10	**1.** In vitro, the overexpression of MLLT10 promoted colorectal cancer (CRC) cell migration and invasion, while after MLLT10 was knocked down, the opposite results were observed. In lung metastasis sites, the knockdown of MLLT10 in SW620 cells significantly inhibited Vimentin expression, whereas the E-Cadherin was increased. These results indicate that MLLT10 regulates the metastasis of CRC cells via EMT.
