NCBI Summary for HOXB9	This gene is a member of the Abd-B homeobox family and encodes a protein with a homeobox DNA-binding domain. It is included in a cluster of homeobox B genes located on chromosome 17. The encoded nuclear protein functions as a sequence-specific transcription factor that is involved in cell proliferation and differentiation. Increased expression of this gene is associated with some cases of leukemia, prostate cancer and lung cancer. [provided by RefSeq, Jul 2008]
UniProt Comments for HOXB9	Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
Research Articles on HOXB9	**1.** These findings suggest that hoxb7 and hoxb9 proteins might play a role in salivary gland tumourigenesis, but in contrast to the reported for other human cancers, they were not significant prognostic determinants in the sample studied
